VERSION HISTORY

VERSION	DATE	RELEASE REMARKS
V1.0.1	16-02-2021	Base Version
V1.0.2	21-03-2021	Motor JSON updates
V1.0.4	20-05-2021	Approval Method Updates

1. INTRODUCTION

This documents in details explains about the different API integration methods to communicate with ECRM Portal.

The process of Policy issuance is completed through below steps:

1. ValidateLogin
2. CreateQuotation,
3. SaveQuoteWithPlan,
4. SaveAddlInfo
5. SaveDocument
6. ProposalSummary
7. ApprovePolicy

API's will follow the restful approach.

2. INTEGRATION

API enables channel partners to do a seamless integration with the Online Portal.

NIA Test Environment URL: <http://129.1.1.42:78/> (Access restricted)

3. PROCESS FLOW

The process flow starts by authentication of credentials using a function. System will validate the account details and returns a valid token if the client is authenticated successfully. The token has to be maintained by the channel partner for performing a series of actions under the authenticated session. Once the session expires, authentication process has to be followed once again.

- Users to request for Quotation information by calling the **CreateQuotation** function; on successful completion of this process, application will generate a quotation reference no which can be used for further processing. This method on successful completion will return the list of plans available with premium details.
- User to select a valid plan and save the quotation details.
- Once the plan is selected, user to key in the policy additional information.
- User can confirm the policy by calling the Approve Policy function, which will generate a Policy Number and migrate policy information to the core system.
- Summary of the policy can be queried through the **PolicySummary** method.

4. API METHODS

a. Authentication

All API Requests to be initiated with a token generated through the login process. Use following API method for generation of an authentication token. This token serves as a key for validating the user access for accessing all the API methods. Once the session (Token) expires, authentication process has to be followed once again.
